Discloses two embodiments of a cable-connecting device shown in Figs. 1 and 2. In the embodiment, according to Fig. 1, the wires of the cable are pressed between a sharp edge (23) and a rounded tip (17) of the main connector body (10). There is no parallelism between the contour of the edge (23) and the tip (17), resulting in a pinching action on the

wires. In the embodiment, according to Fig. 2, the wires are clamped between a rounded contour (23') of the outer part (20') and the conical tip (15') of the main connector body (10'). Although the contours may be parallel, the clear width of the clamping part (20') exceeds the outer diameter of the counterpart (13'), resulting in substantial friction, when the bodies 20' and 13' are moved relative to each other in axial direction with the wires of the cable lying in the gap between both bodies.

Discloses a cable connector wherein the wires (3) of the cable (4) are pressed between the conical tip (2) and a sleeve (5) with a conical bore. Although the pressing parts (2, 5) are both conical, their cone angles are different, such that there is no parallelism between the pressing faces.
